

**Amendments to the Claims:**

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. - 14. (Cancelled)

15. (Currently Amended) ~~An image-capturing apparatus~~ electronic still camera comprising:

an image-capturing device that captures an image of a subject and outputs signals under first color coordinates comprising a plurality of color components;

an image processing device that performs image processing on the signals output from the image-capturing device; and

the image processing device including a color coordinate conversion unit that converts the signals output from the image-capturing device into signals under second color coordinates comprising a luminance component and color difference components, and ~~;~~ ~~and~~ a color difference signal correction unit that receives signals corresponding to the color difference components, and outputs corrected signals corresponding to the color difference components and a correction amount for a signal corresponding to the luminance component by using a two dimensional look-up table based upon the received signals corresponding to the color difference components.

16. (Currently Amended) ~~An image-capturing apparatus~~ electronic still camera according to claim 15, wherein the color coordinate conversion ~~device~~ unit converts the signals under the first color coordinates into the signals under the second color coordinates by matrix calculation.

17. (Currently Amended) ~~An image-capturing apparatus~~ electronic still camera according to claim 15, further ~~comprising;~~ comprising:

the image processing device including a luminance signal correction unit that corrects the signal corresponding to the luminance component with the correction amount and outputs a corrected signal corresponding to the luminance component;

a compression unit that compresses the corrected signal corresponding to the luminance component and the corrected signals corresponding to the color difference components to generate compressed image signals; and

a recording unit that records the compressed image signals.

18. (Currently Amended) An image processing method for an ~~image-capturing apparatus~~ electronic still camera, the method comprising:

capturing an image of a subject with an image-capturing device;

outputting signals under first color coordinates comprising a plurality of color components from the image-capturing device;

converting the signals output from the image-capturing device into signals under second color coordinates comprising a luminance component and color difference components; and

outputting corrected signals corresponding to the color difference components and a correction amount for a signal corresponding to the luminance component by using a two dimensional look-up table based upon the converted signals corresponding to the color difference components.

19. (Currently Amended) A computer-readable computer program product containing an image processing program stored on a recording medium for an ~~image-capturing apparatus~~ electronic still camera, the image processing program comprising instructions to:

capture an image of a subject with an image-capturing device;

output signals under first color coordinates comprising a plurality of color components from the image-capturing device;

convert the signals output from the image-capturing device into signals under second color coordinates comprising a luminance component and color difference components; and

output corrected signals corresponding to the color difference components and a correction amount for a signal corresponding to the luminance component by using a two dimensional look-up table based upon the converted signals corresponding to the color difference components.

20. (New) An electronic still camera according to claim 15, wherein when the two dimensional look up table does not store data corresponding to the received signals, the color difference signal correction unit performs linear interpolation to generate the data corresponding to the received signals.
